INTRODUCTION

Swaziland has an area of 6,704 square miles and is bordered on the north, west and south by the Transvaal, and on the east by Mocambique and Zululand.

The Territory is geographically divided into four well defined regions, running from north to south, namely the mountainous highveld in the west with an altitude of 3,500 and 5,000 feet, the middleveld with an average altitude of 2,000 feet; and the lowveld or bushveld with an altitude of 1,000 to 300 feet; and the Lubombo Plateau on the east, with an altitude of 2,000 feet. Scenically the Territory is one of the more attractive parts of Africa. The highveld has a temperate climate and frosts occur during winter. The climate of the middleveld is subtropical and that of the bushveld almost tropical, although every few years a frost does occur.

Rainfall, which occurs chiefly in the summer, varies between approximately 30" a year in the lowveld. Drizzle and mists are frequent in the highveld areas. The country is well watered by numerous perennial streams and rivers, some of which are of a considerable size and now provide water for three large irrigation schemes, which have been established at Mhlume in the north-east, at Big Bend in the east (at both of which sugar is grown) and at Malkerns in the centre of Swaziland (which produces rice, sub-tropical fruit and citrus).

In addition to the irrigation schemes, other important agricultural activities are cattle ranching and seed cotton production in the bushveld and sub-tropical fruit, maize and rice production in the middleveld, in the southern portion of which a considerable amount of tobacco is also grown. In the mining field, Havelock Mine in the north-west is a most important producer of asbestos, and with the opening of the railway in November 1964, connecting Swaziland with Lourenco Marques, the mining of iron ore at Ngwenya and of coal at Mpaka got underway. A pulp mill and a sawmill are operating at two of the forestry concerns in the highveld.

A census of the total population was held in May 1966. This was the first census of all the people in Swaziland.

The figures are as follows:

African 362,367
Europeans 7,987
Other Non Africans 4,217
Total 374,697

One half of the area of the territory is in communal ownership of the Swazi Nation and the remainder owned by individual tenure farmers. The Swazi have the exclusive use of the communal tenure areas and the remainder is open to farmers of all races without discrimination. Swazi dwellings for the most part consist of wattle-and-daub structures, or bee-hive huts, and small family collections of these huts are widely dispersed. Other than in the neighbourhood of the larger towns, there are no villages. Whilst the agricultural activities of the Swazi are still, in the main, concentrated on the raising of cattle and goats and the cultivation of maize, the work of the Agricultural Department is now producing results, and both the standard and scope of Swazi farming are improving year by year.

The following hospitals exist:

A. Run by Government

Mbabane Hlatikulu Piggs Peak Mankaiana Mahamba (Tuberculosis) Goedgegun	142 50 33 30	beds beds beds beds beds
	896	beds

B. Run by Missions

Raleigh Fitkin Memorial, 275 beds Manzini Good Shepherd, Stegi 67 beds

C. Run by Industry

Havelock Mine Hospital 65 beds

D. Run Privately

St. Michael's Clinic 12 beds

Total: 896 beds

Apart from these formal hospitals there are two bedded dispensaries or clinics run by industrial concerns which can accommodate up to about 20 patients each.

The rural areas are catered for by 44 clinics staffed by trained nurses, 27 of them being conducted by Missions and 17 by Government. The Southern area of Swaziland is fortunate in having had a doctor appointed by the Save the Children Fund who runs a mobile clinic and conducts regular clinics at eight different places.

There were 50 doctors, of whom 12 were licensed medical practitioners, 2 dental surgeons in the territory in 1966. 2 of the doctors were not in practice. Of the 48 practicing doctors, 17 were concerned with Government medicine, 9 with Mission work, 9 with Industrial Medicine, 12 in private practice, and 1 doctor was concerned with Save the Children Fund.

The Mbuluzi Leper Hospital, situated 10 miles from Mbabane and run by the Nazarene Mission, with the assistance of a Government grant, copes most adequately with the small number of lepers in the Territory. There is no mental hospital, and dangerous and violent lunatics are detained and treated in sections of the gaols.

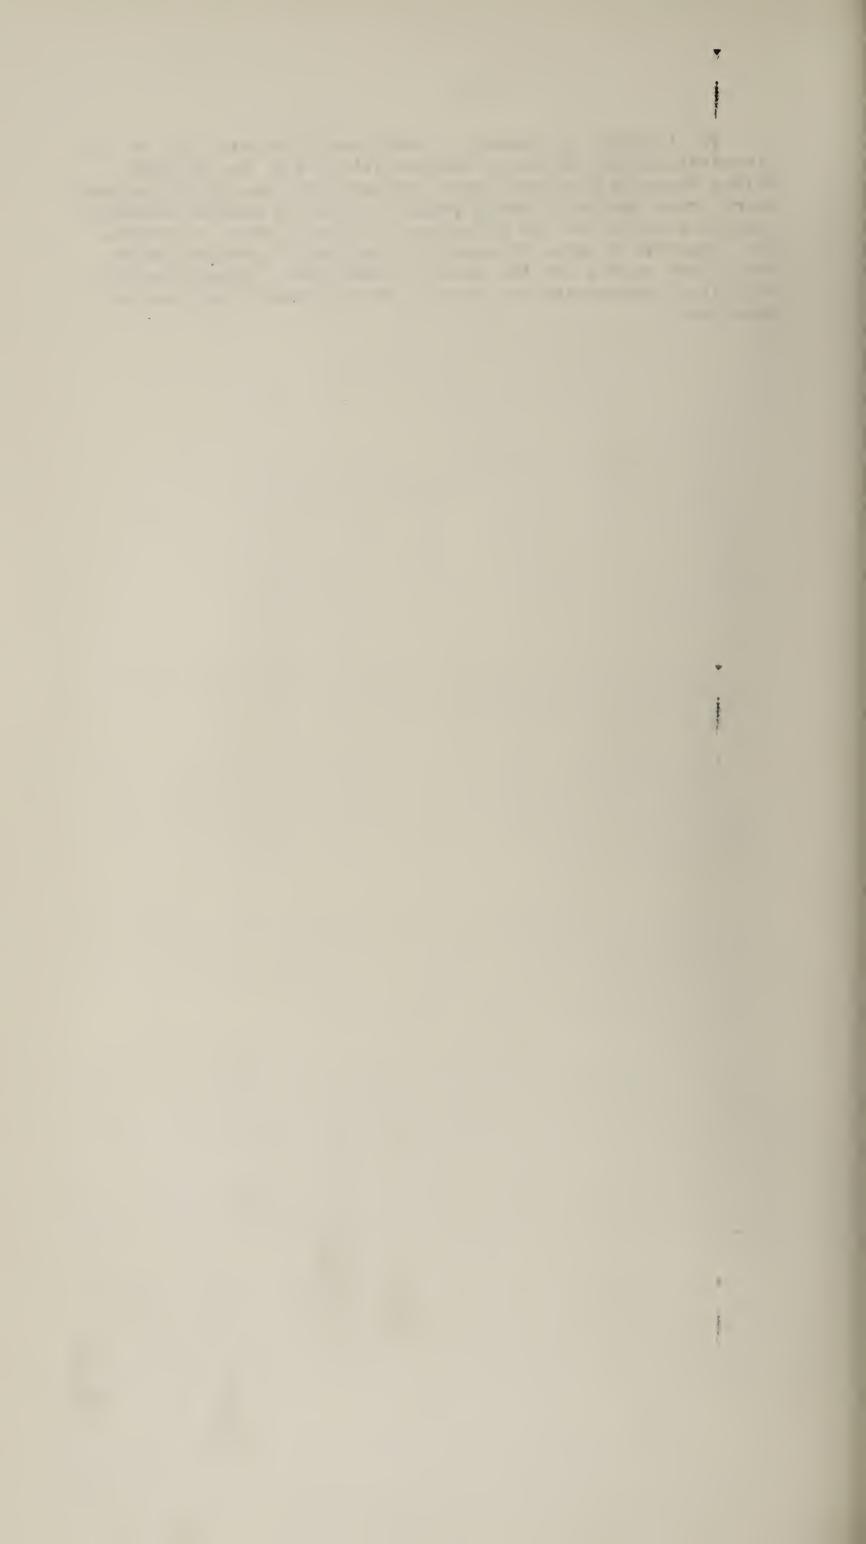

The British Red Cross Society is now running Infant Welfare Clinics at Mbabane, Hlatikulu, Stegi, Piggs Peak, Manzini, Kwaluseni, Mhlambanyati and Goedgegun, at which most useful work is being done. The Save the Children Fund has started a school feeding scheme.

The Public Health Services of the territory are centred at the Health Office in Manzini for the control of Malaria and Bilharzia and at Mbabane which controls environmental health, Health Education and a Public Health Nursing Unit. There is a Pathology Laboratory at which routine serological, biochemical, bacteriological and haematological investigations are carried out.

The Medical Association of Swaziland whose members include private practitioners, medical missionaries and Government medical officers, hold quarterly meetings, which are well supported and which make up to some extent for the lack of professional contact so common in territories such as Swaziland.

The training of nurses in Swaziland is carried out at the Ainsworth Dickson Training College attached to the Raleigh Fitkin Memorial Hospital, where training for the High Commission Territories Nursing Council qualifications in General Nursing, lasting 4 years, and in Midwifery, lasting 1 year, is given. The Ainsworth Dickson Training College can at present train sufficient nurses for the needs of Swaziland. Dispensers and Laboratory Assistants are trained at Government Hospitals as required.

CHAPTUR I

REVIEW OF THE YEARS WORK

The Hon. A. Z. Khumalo held the post of Nember for Health on the Swaziland Executive Council throughout the year 1966. During this period he took a most keen and active part in the affairs of the Department, visiting every Government, Mission, industrial and Swazi National Council hospital and clinic throughout the Territory.

2. Staff

Dr. J. Alexander was promoted to Senior Medical Officer on 1st April, 1966 and Dr. J. Klopper was promoted to the post of Deputy Director of Medical Services on his return from overseas study on 26th November. The recruiting of Medical Officers improved markedly during the year and it was possible to fill the post of T.B. Medical Officer. At the end of the year only three Medical Officer posts remained vacant and one of these was filled by a Locum Tenens, thus leaving a deficit of only two Medical Officers.

The supply of trained nurses continued to exceed the demand and by the end of the year only two expatriate nursing sisters remained in the nursing service.

3. Hospitals and Clinics

The new operating suite at Hlatikulu Hospital was completed, a Government clinic was opened at Gege and a new Nazarene clinic opened at Esigceveni and a new Roman Catholic clinic completed at the Florence Mission Station. With the completion of the Prisons Building Programme, prisoners were transferred from the old Mbabane Prison to the new Prison. This made it possible towards the end of the year to transfer all mental cases which had until then been housed in district prisons to the old Mbabane Prison, and thus form the beginning of a Mental Institution. As it was evident that at some stage the United Kingdom military forces would be withdrawn from Swaziland and the Matsacha Barracks left vacant, a plan was drawn up for the utilisation of these barracks by the Medical Department. With the evacuation of the troops which occurred in November, rather sooner than expected, this plan was put forward to the Executive Council for consideration. After deliberating on the plans put forward by various departments, the Executive Council eventually allocated the barracks for the use of the Medical Department. The Plan proposed by the Medical Department included the following main usages:-

- 1. Conversion of the gate house to a clinic to meet the needs of the local population.
- 2. Conversion of the Quarter Master Store to a Central Medical Store including using the motor transport workship as a manufacturing unit for stock mixtures, ointments etc.
- 3. The conversion of the main kitchen and dining Hall and four adjacent barrack blocks to a 200 bedded adult T.B. Hospital using the sick bay for cases requiring more intensive nursing.
- 4. Conversion of the NAAFI and four adjacent barrack blocks to a 200 bedded mental hospital.
- 5. Conversion of the Sergeants and NCO's mess to a 90 bedded childrens TB Hospital.
- 6. Conversion of the Officers Mess to female staff accommodation.

Obviously the full utilisation of the Matsapha Barracks will have to be phased as staff and funds become available.

In Government Hospitals the total admissions of full-paying patients fell slightly, but the admissions of part-paying patients increased by just over 2,000, i.e. about 20%.

The average daily number of patients in hospital rose to 719, which was a 15% increase over 1965. There was a slight fall in the number of o perations performed and in the out-patients attendance. There was a very large increase in the number of patients attending maternity and childwelfare clinics and this was accompanied by a 24% rise in the number of confinements conducted in Government Hospitals.

The total expenditure by the Department rose to over R676,000, which was an increase of some 19.5% over 1965. The Department received about 11.6% of the total revenue of the territory.

4. Significant Diseases

Tuberculosis - the work of the T.B. Control Unit progressed well. Again there was a significant rise in the number of cases voluntarily seeking treatment.

Malaria - There was some small increase in the number of cases of malaria, but due to the abnormal rains following Cyclone Claud, a large increase can be expected in 1967.

Malnutrition - the number of cases of malnutrition and kwashiorkor treated in hospitals showed a marked increase.

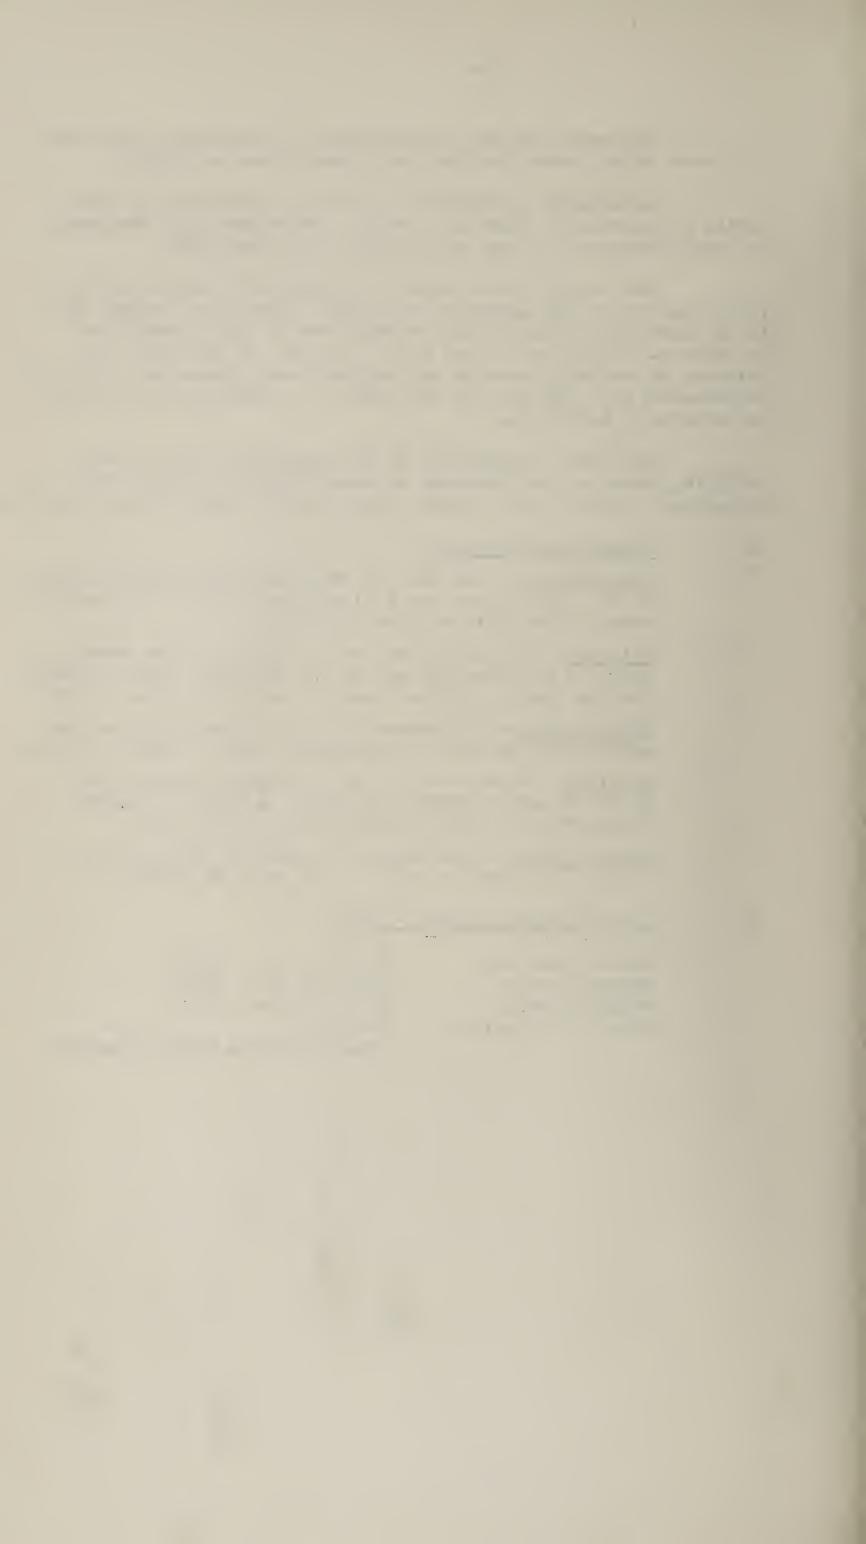

Smallpox - There were 73 cases of Smallpox with three deaths reported during the year. A total of 51,000 vaccinations against smallpox were carried out.

Enteric Fever - The number of cases of Enteric Fever dropped from 300 in 1965 to 154 with 10 deaths.

- 1. Dr. H. J. L. Burgess Inter-Country Nuatition Consultant, W.H.O.
- 2. Dr. W. J. M. Evans, C.B.E. Deputy Medical Adviser, Ministry of Overseas Development.
- 3. Dr. Schaffer Lecturer in Public Administration, University of Sussex.
- 4. C. M. Curruthers, Esq. Field Director of OXFAM.
- 5. A. C. Gilpin, Esq.- U.N. Regional Representative, Lusaka.
- 6. F. Judd, Esq. Secretary General, I.V.S.
- 7. S. Hoelgaard, Esq. and Mr. Glen-Davies UNICEF.

CHAPTER II

COMMUNICABLE DISEASES

1. TUBERCULOSIS

GENERAL:

While the T.B. Control Project continued to develop satisfactorily during the first six months of the year, progress was drastically hampered during the second half of the year because of the inconsiderate transfer of staff painstakingly trained during the past years. Nevertheless, the period under review was marked by a far-reaching achievement as far as tuberculosis control is concerned.

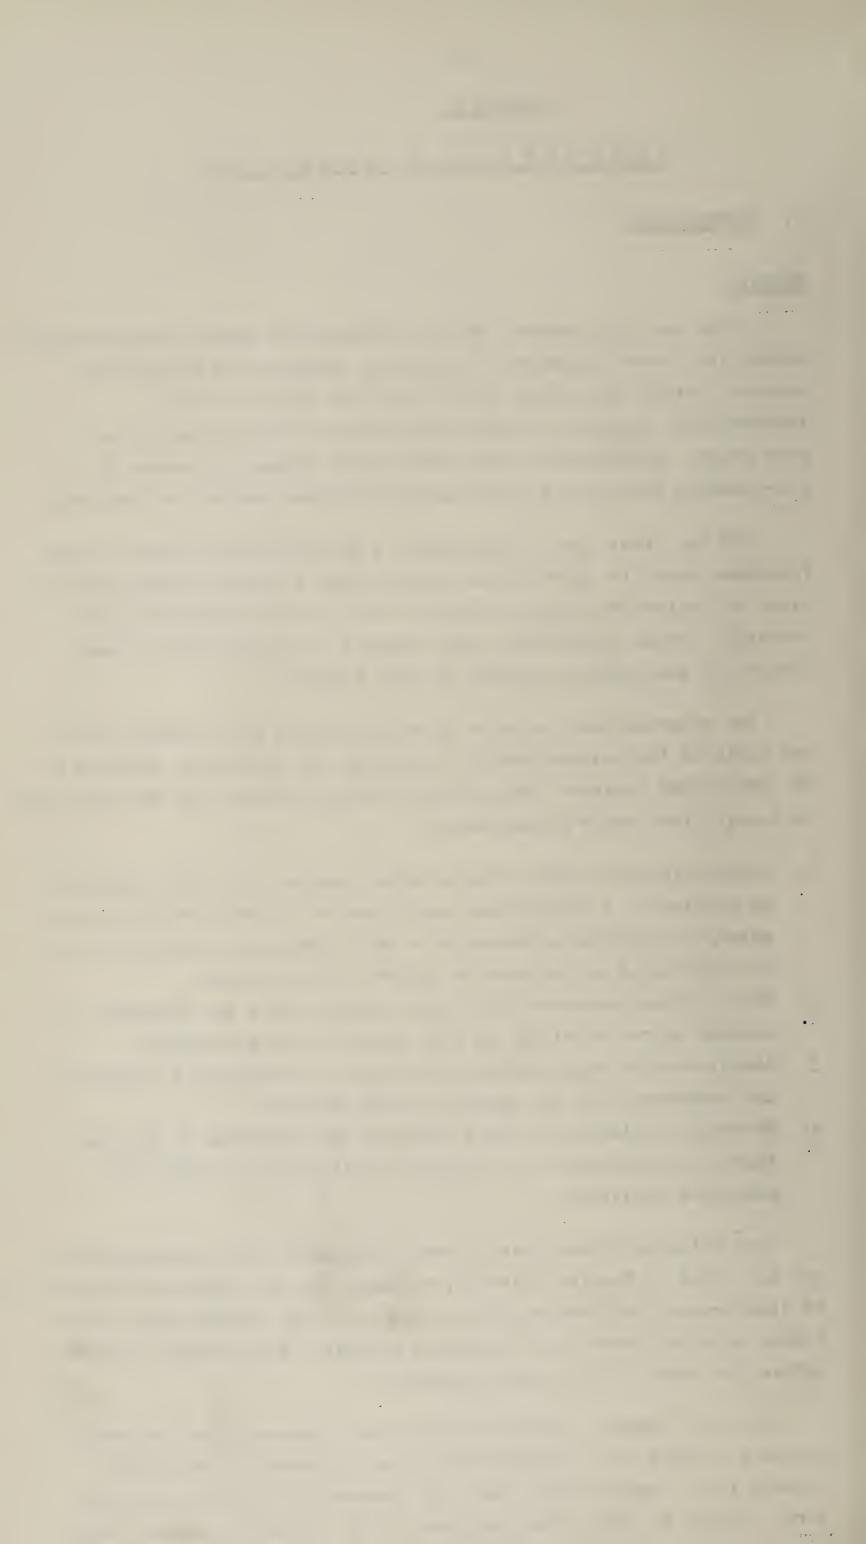

For the first time in Swaziland, a National Tuberculosis Control Programme meant to approach the problem from a public health point of view, as against the purely clinical one, the usual approach until recently, became operational, thus marking a crucial point in the history of tuberculosis control in this country.

The programme was prepared in detail during the previous year on the basis of the epidemiological knowledge and experience acquired by the WHO-UNICEF assisted Tuberculdsis Control Project, and was formulated to satisfy four basic requirements:

- 1. Epidemiological considerations which required that the programme be applied on a country-wide scale and on a permanent basis since patchy or sporadic application of anti-tuberculosis measures has no significant or progressive impact on the problem.
- 2. Sociological considerations which demanded that the programme be adapted to the existing and real needs of the population.
- 3. Administrative considerations that made it mandatory to integrate the programme into the general health services.
- 4. Economic considerations that required the programme to be such that its application on a national scale would be within the resources available.

The National Tuberculosis Control Programme whose implementation was initiated in Manzini district, contempl tes the uniform utilization of of standardized anti-tuberculosis means and their country-wide application with the basic aim of bringing essential tuberculosis services within the reach of the entire community.

For this purpose, simple but essential diagnostic and treatment services started to be established within existing general health centres (i.e. hospitals and rural and industrial clinics), which in turn, started to offer these services to the population within their

-0-

reach as an integral part of their routine activities.

Diagnostic activities of these general health centres were concentrated on those patients who consulted because of respiratory symptoms, and mostly consisted of forwarding for investigation to the TB Centre's laboratory specimens of sputa collected from such symptomatic patients. Whenever possible, patients with respiratory symptoms were also referred to the TB Centre for a free chest X-Ray.

Patients thus detected and in need of chemotherapy, were offered free treatment at the health centre they originally consulted, or at any other health centre of their choice co-operating in the fight against tuberculosis. Treatment was carried out on an ambulatory basis and consisted of one daily self-administration by the patients of the prescribed daily dosage of anti-tuberculosis tablets which were issued to the patients at monthly intervals. Supervision of treatment and investigation of treatment default was conducted by the staff in charge of the health centres administering treatment, assisted whenever necessary by a special team of "Home Visitors" from the ".B. Centre.

Throughout the year, the TB Centre provided these general health centres with its specialised services and technical advice, supervised their newly-integrated anti-tuberculosis activities and took care of all the functions that lay beyond their own capacities and equipment. Thus, besides performing bacteriological and radiological examination for the whole country and conducting treatment supervision on a national scale, the TB Centre trained the staff of twenty such health centres in basic tuberculosis control measures including recording and reporting procedures.

It also maintained contact between all health centres carrying out anti-tuberculosis work, co-ordinated their specialised activities set standards, and by keeping the National TB Register in order, was able to guide and help the health centres involved in their efforts of supervising the patients under their care and prevent and "cure" treatment default. In this connection, however, it must be pointed out, that in spite of re-iterated efforts to this effect, the staff of these general health facilities still did not, by the end of the year fully appreciate the basic necessity and importance of the new-introduced, standardized recording and reporting procedures, a sine qua non of any comprehensive, nation-wide anti-tuberculosis programme.

In addition to the country-wide establishment of diagnostic and durative tuberculosis services, the National Tuberculosis Control Programme also contemplates the creation of a preventive service based upon BCG vaccination, combined with inoculation against Smallpox.

Owing to the epidemiological situation. it was decided to focus the vaccination service on the age group nil to 14 years of age. Field trials having proved that a very high percentage of this age group could be contacted through the numerous schools covering the country, it was also decided to utilize these schools as vaccination centres, not only for school children, but also for pre-school children and non school attenders eligible for vaccination. Preparation of a plan of operations based on these lines was initiated late in the year.

Besides offering its specialised services to the whole country, the Tuberculosis Control Centre's laboratory started to conduct on a probatory basis general laboratory investigations in view of its eventual transformation into the country's central public health laboratory.

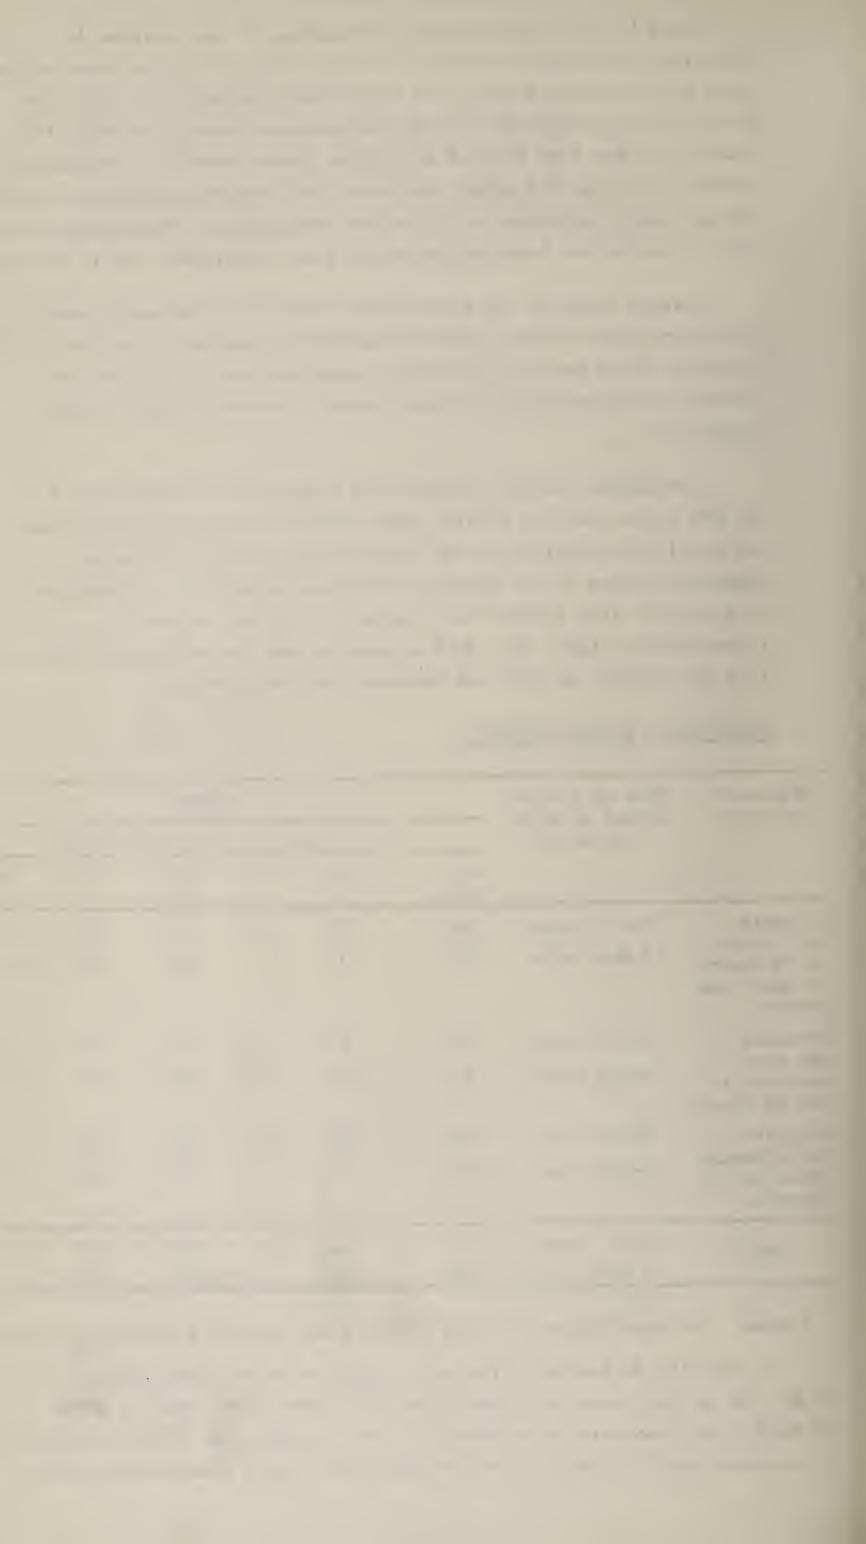

A Government Medical Officer was appointed as counterpart to the WHO Senior Medical Officer thus opening the way to the eventual and complete appumption of the Tuberculosis Control Project's responsibilities by the Government Medical Authorities. Furthermore, as the first step towards the phasing out of the project's international staff, the WHO Statistician and the WHO X-Ray Technician left the country in July and December 1966 respectively.

OPERATIONAL ACCOMPLISHMENTS:

Origin of Patients:	Type of Exami- nation to which			F	ERIOD:		
	subjected:	***	1965	5:		1966:

who attended other Health Centres.	X-Ray exam ⁺	12749	۷۰.3	5,7	7645	239	3.1
TOTAL:	Bact. exams:	5120	718	14	6964	747	10.7
	X-Ray exams:	15649	1042	6.6	11108	668	6

⁺ Note: includes X-Rays taken by Mobile X-Ray unit at industrial centres.

In addition to the above figures, (which refer to case-finding only(, the project also performed during the year under review a total of 5083 bact. examinations of which 1724 were repeat, and 3359 were follow-up examinations. In addition to the diagnostic X-Ray examinations above

quoted, the project also performed a total of 2158 follow-up X-Rays.

According to the figures entered in the National TB Register and provided by the general health centres, 574 patients in need of chemotherapy initiated treatment in 1966 all over the country.

At the end of the year the National TB Register contained information on 2226 patients, made up as follows:

Cases (patients excreting tubercle bacilli, when detected)	891
Suspects (patients with X-Ray pulmonary lesions, suspecious of TB, but not excreting tubercle bacilli when	
detected)	1098
Contacts	237
	2226

The number of TB deaths, according to the TB register for 1966 was 122.

2. MALARIA: The Report covers the transmission period 1st July, 1965 to 30th June, 1966.

SUMMARY: Plasmedium falciprum is still the most common parasite encountered. Of the 27' positive blood smears P. falciprum was present in 199 cases as a single infection. It was also found in ll cases with P. malaria and one case with P. vivac.

As in previous years cases are still being imported into the territory especially from Mocambique. The annual parasite incidence (i.P.I.) was 1.11 per thousand and the annual blood examination Rate (A.B.E.R.) was 13.74 of the population at risk. In 1964/65 this population was estimated at 107000 but the territorial census in early 1966 showed this ligure to be grossly underestimated. The figure now used is 193,000, which includes 51,000 in the maintenance phase and 144,000 in the consolidation phase. 26,860 blood smears were examined by the three microscopists.

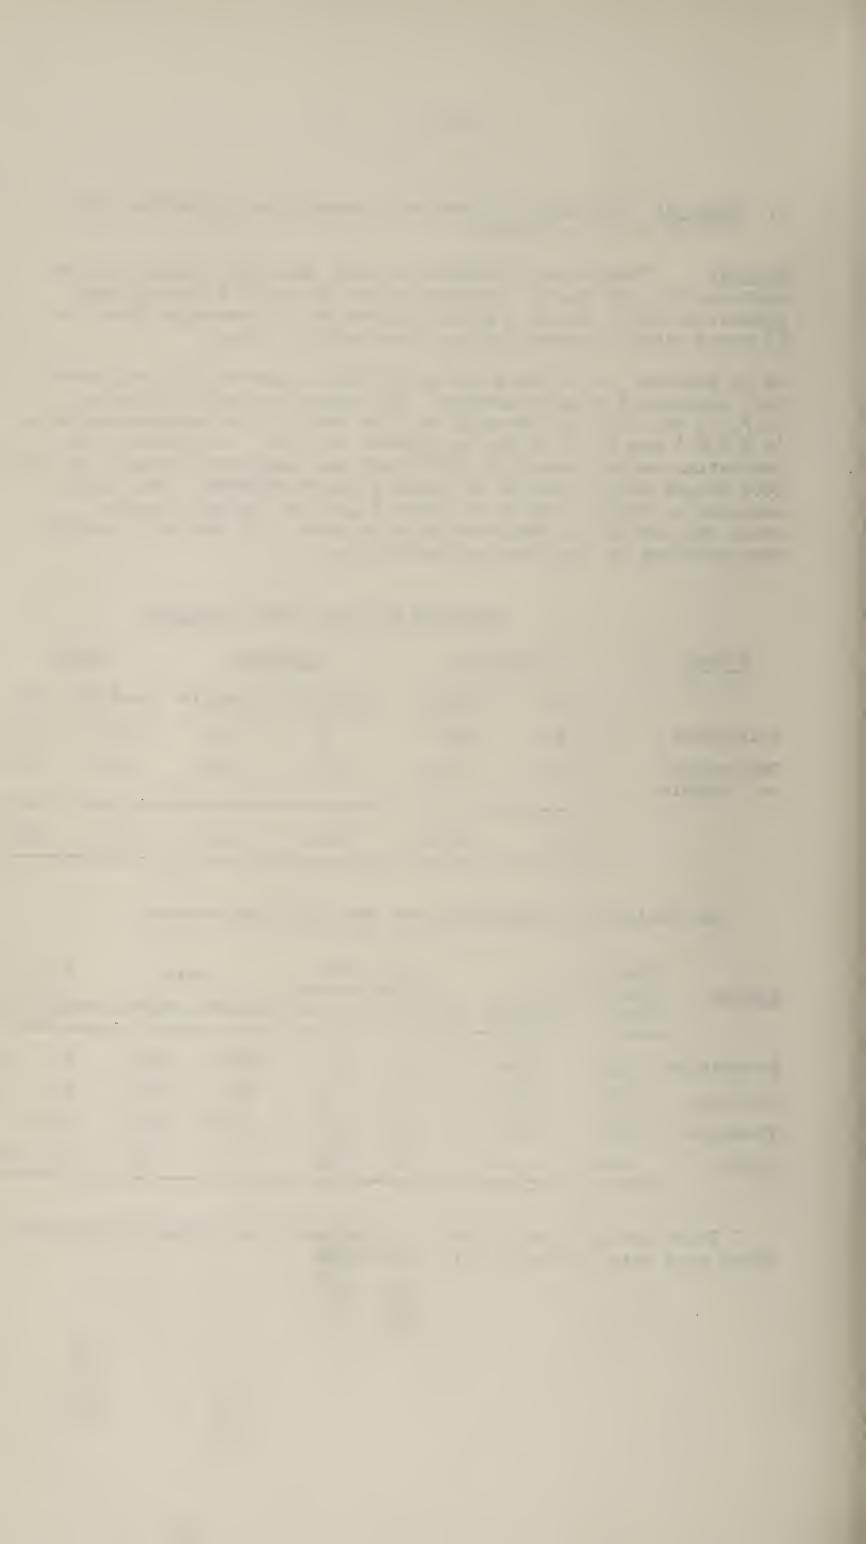

ANALYSIS OF BLOCD FILMS EXAMINED

Source	Neg	ative	Posit	i.re	Tota	1
	2.924/65	1965/66	1964/65 (5)	196 5/66	a964/65	1965/65

Other	88	59	5	15	93	66	5.37 22.7

Forty one per cent of the P. falciprum cases showed gametocytis. These case were present in all age groups.

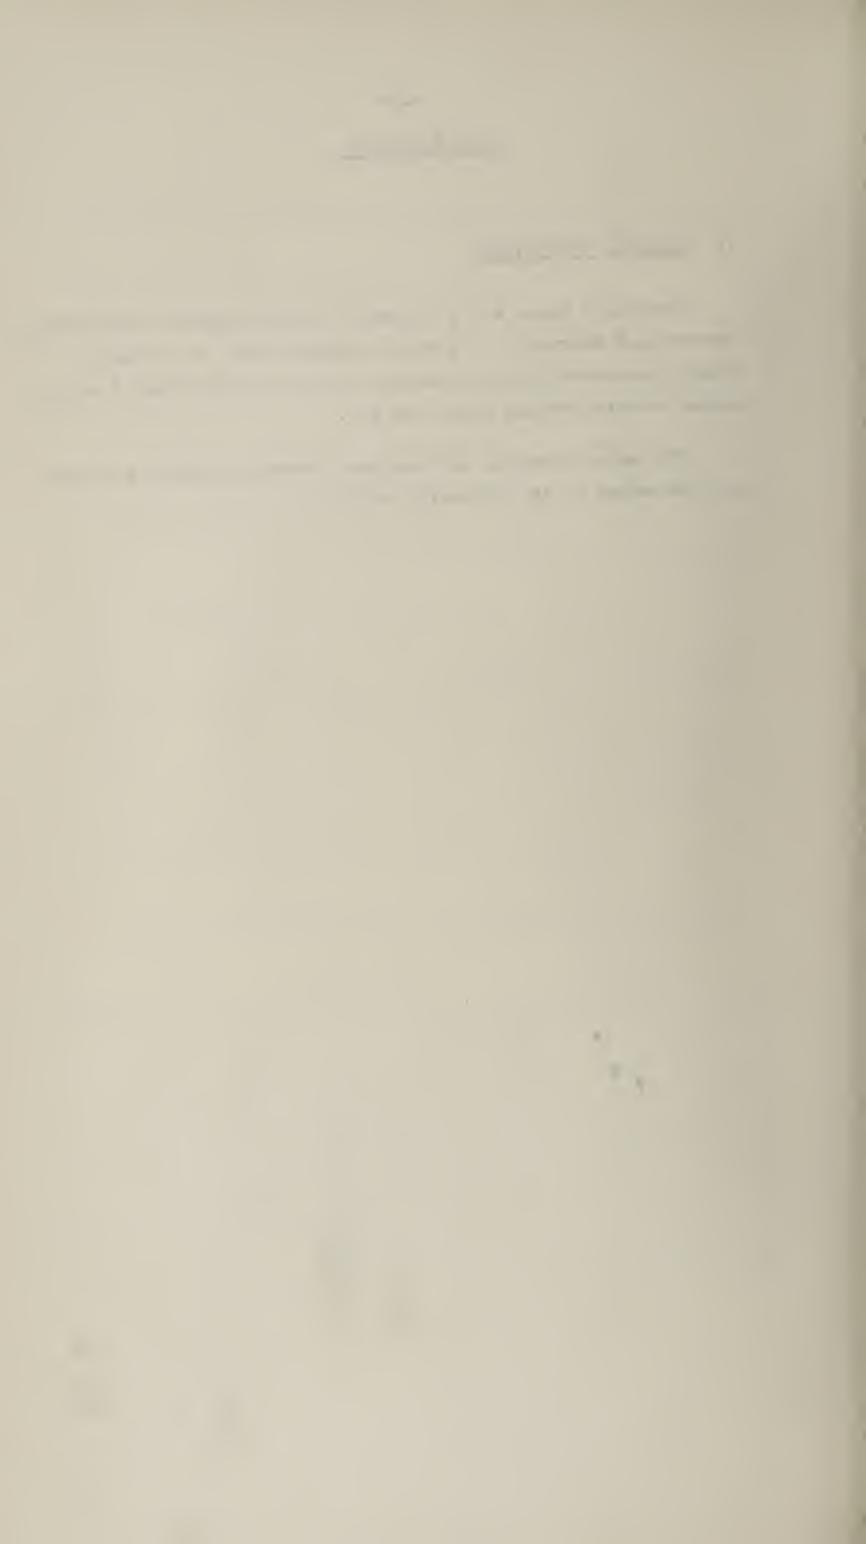

METEOROLOGICAL

1. CLIMATIC CONDITIONS.

Unusually heavy rai s occurred in the bushveld areas during January and February. A gambiae breeding was, as a result, fairly widespread during January to May, the majority of malaria cases occuring during April and May.

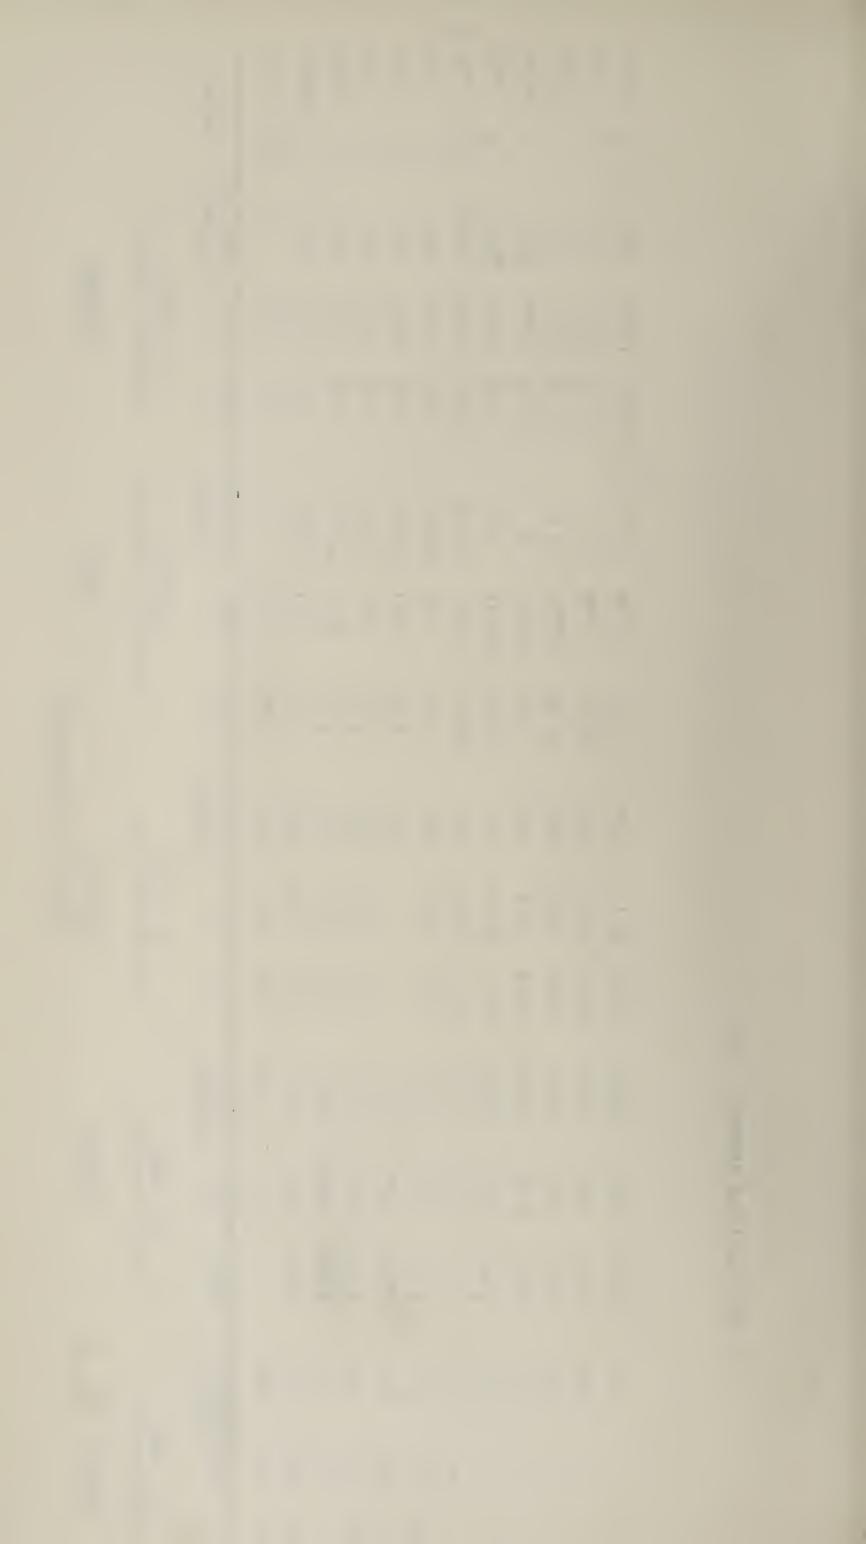

The meteorological records from various bushveld stations are reflected in the following table:

June	May	April	March	Feb.	Jan.	Tec.	Nov.	Oct.	Sept.	August	July	Mo		
=	=	12	=	=	196.	ests expl		40 40	=	t =	1965	Month

Annual Staff Meeting ../

2. ANNUAL STAFF MEETING:

At the annual staff meeting held at Manzini during the first week of August, individual problems were discussed and the staff were informed of their duties for the new malaria season.

3. POPULATION AND HUT COUNT.

This was not done by the malaria staff but figures available from the Territorial census carried out during May 1966 are as follows:

Maintenance phase : 51,000

Consolidation phase : 144,000

Total : 195,000

4. MALARIOUS AREAS:

The boundaries of certain areas were re-defined and in some cases areas were reduced. This has enabled field assistants to cover their areas in less time and also saved time in not working unnecessary sections where no trouble was anticipated.

5. MEETINGS:

In view of the considerable misunderstanding about the objects of our work, meetings were held with chiefs, indunas and others at the following places in order to explain our aims and objects:

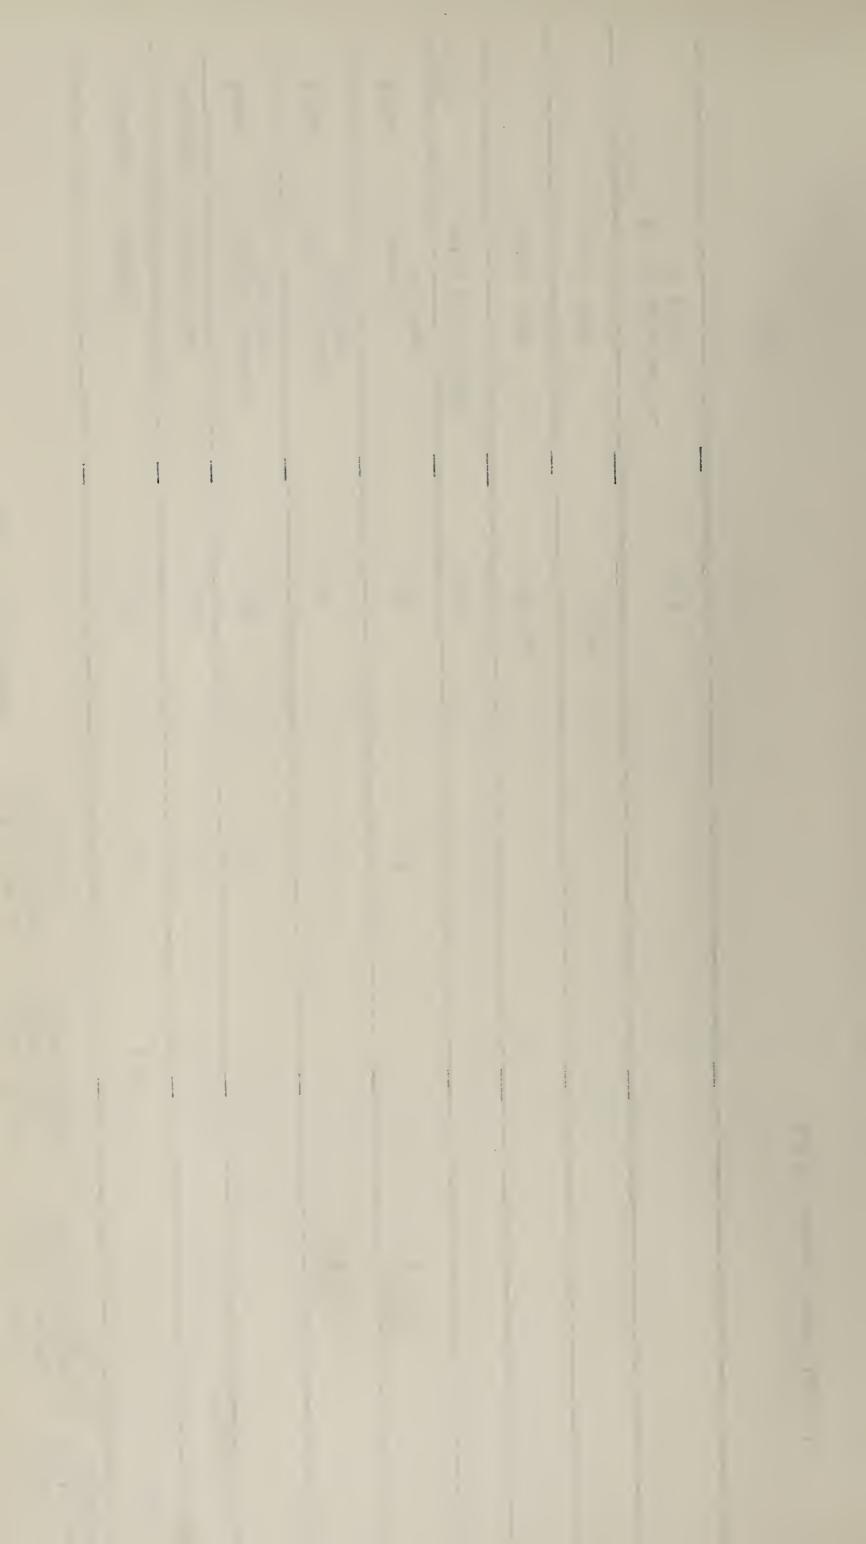

Mpaka
Nyetane
Lukula
Ngomane
Nkamanzi
Border Gate
Magomba
Nomahasha
Majembeni
Mpolonjeni

6. MALARIA CONTROL MEASURES:

(a) Residual Spraying. with Benzine Hexachloride 12% Gamma Isomer wettable powder, was carried out at Border Gate, Sivunga and Big Bend. Technical D.D.T. was also used at Big Bend. Particulars are as follows:

				3.9	No. of Huts per 1b. of B.H.C.	
				3 lbs	D.D.T. used	
				180 lbs	B.H.C. used	
				716	Total No. of Huts	-15-
Î	Ò	-ear	6.0	62	Harmonie Big Bend	March

0	0	0.1	1.5	221	Border Gate	December
0.19	0	1.9	1,2	248	Sivunga	December
A.A.D. for A Funestus Gr. shortly after spraying	A.A.D. for A. Gambiae shortly after spraying	A.A.D. for A. Funestus gr. before Spraying	A.A.D. for A. Gambiae before Spraying	Nc. of Huts Sprayed	Place	Date

A.A.D. = Average Anopheline Density per Hut

As can be seen from the results, there were no indications of resistance to B.H.C. or D.D.T.

2. SIVUNGA.

5 weeks after spraying the A.A.D. for A. Gambiae was 0.5 and the A.A.D. for A. Funestus Gr. was 0.15 weeks after spraying the A.A.D. for A. Gambiae was 0.05 and the A.A.D. for A. Funestus Gr. was 0.03.21.4.66 19 " " " " " 0.03

BORDER GATE.

17 weeks after spraying 25.5.66 22 weeks after spraying 12 weeks after spraying weeks after spraying the A.A.D. the A.A.D. the A.A.D. the A.A.D. for A. for A. for A. for A. Gambiae was 0 Gambiae was 0 and the A.A.D. for A. Funestus Gr. Gambiae Gambia was 0 and the A.A.D. for A. Funestus Gr. was 0.08 and the A.A.D. for A. Funestus Gr. was 0 and the A.A.D. for A. Funestus Gr. was O was 0 was 0.03

4. BIG BEND.

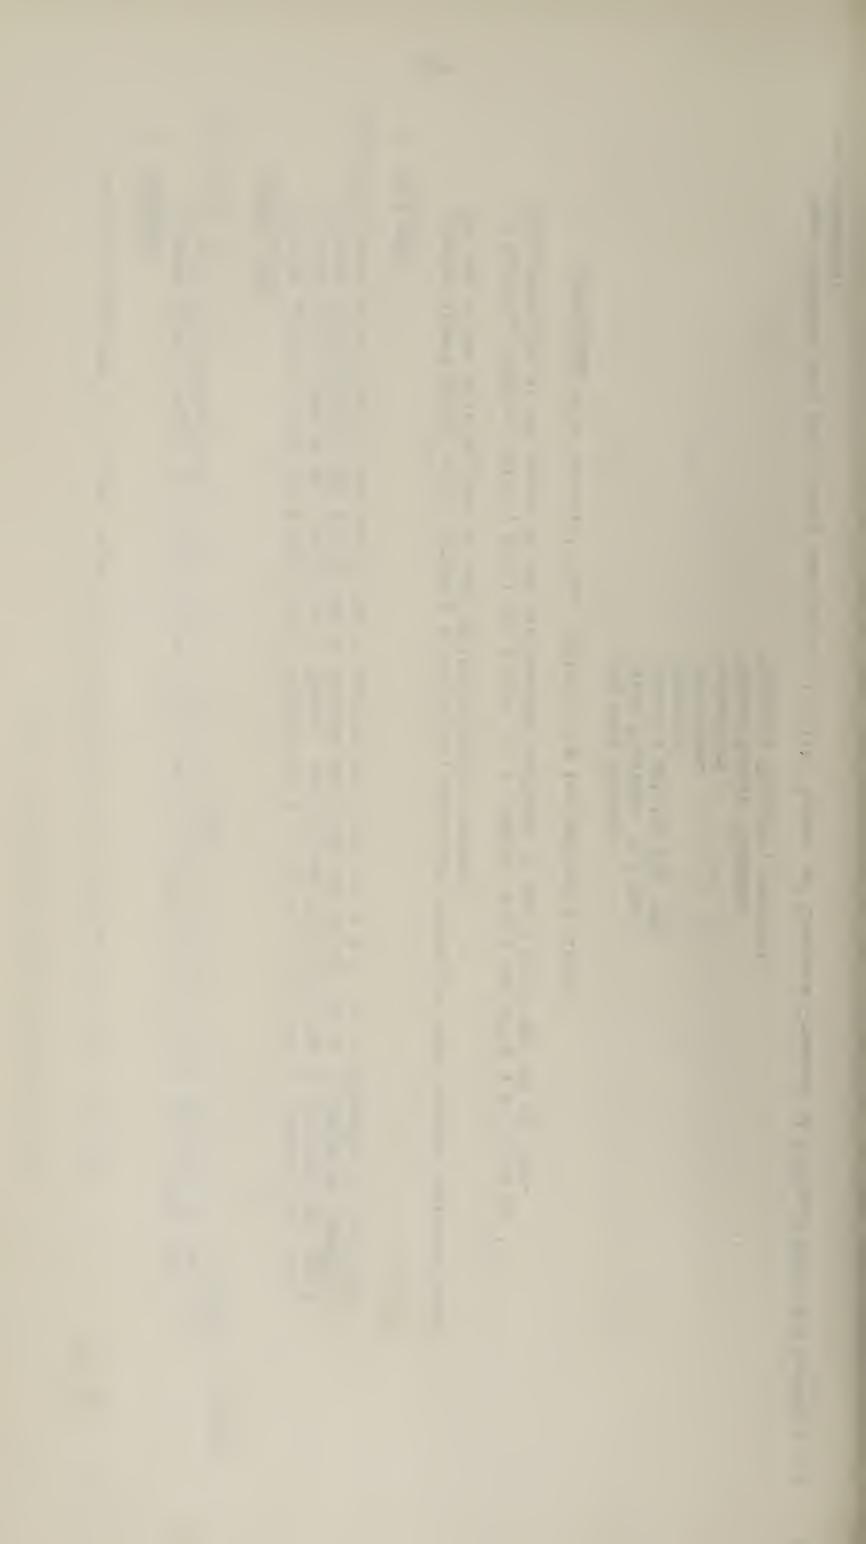

Regular almost weekly space spraying at Paciardie, Mfula and Poortzicht after residual spraying until the end of the malaria year in June failed to produce vectors.

Thereafter due to the onset of the cold weather probably it was 0 up to the end of June. At Harmonie however, after 7 weeks the A.A.D. for A. Gambiae was 2 and after 9 weeks it was 0.2

Larvaciding with "malariol" was carried out at the following places:

Big Bend Ranches
Mfula Planters, Big Bend
Picardie Estates Big Bend
Harmonie
Poortzicht
Canterbury
Hilton Barber, Tshaneni
Thompson Crammond, Tshaneni

extensive. These measures were only really successful at Hilton Barber and Thompson Crammond at Tshaneni where the breeding was

(c) Drug Prophylaxis: All employers of labour in the malarious area were requested to issue Darachlor to employees visiting Mocambique in an attempt to further reduce the incidence of parasite carriers. In the case of Thambankulu Estates it was found to be more practical to dose all foreign labour weekly with Darachlor instead of trying to keep track of and dosing those visiting malarious areas and other countries, where malaria is indigenous.

Drug prophylaxis was instituted at the following places:

Volinde	(Darachlor)
Mpofu	H
Nkamanzi	ହ ହ
Ngomane	11
Bar J. Ranch Big Bend	10
Mkhayahovu Big Bend	11
Langa	(Daraprim)

(d) <u>Surveillance Operations</u> were continued by the field staff who were concerned mainly with routice blood taking, hut space spraying and larval collecting.

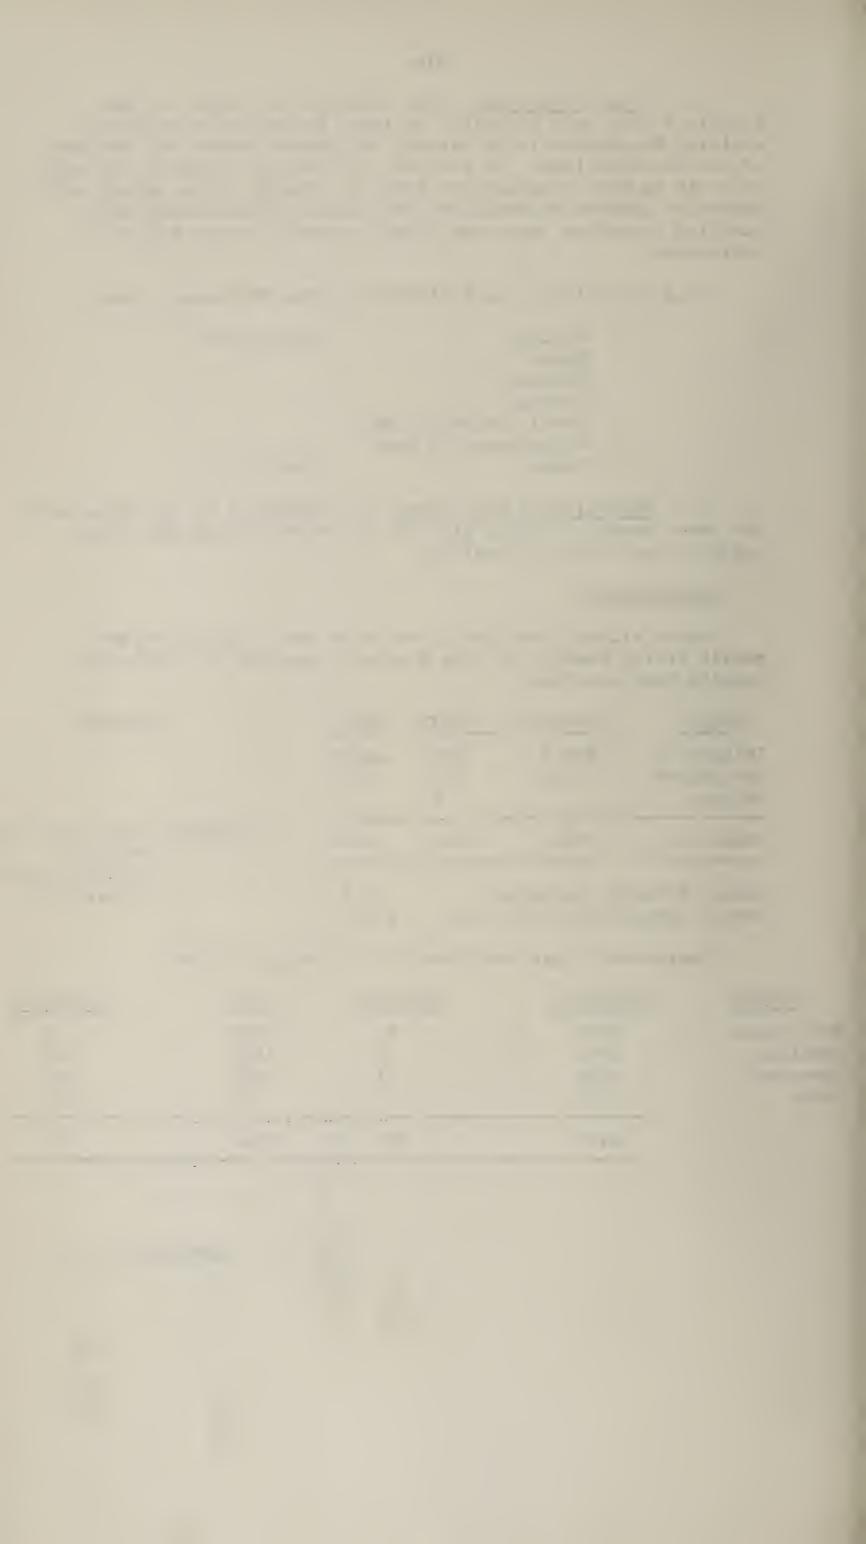

7. PARASITOLOGY:

Blood slides taken during the year were examined at the Health Office Manzini by four Microscopists and the following results were recorded:

SOURCE	NEGATIVE	POSITIVE	TOTAL	SPECIES

8. ENTOMOLOGY.

(a) Hut Space Spraying. The results of this work carried out by the field staff were as follows:

No. of Huts tested : 13,904 (Excludes space

No. of A. Gambiae found : 859 spraying mentioned i

No. of A. Funestus group found : 334 8(c) as follows:

No. of other Anophelines found : 469

135 A Pretoriensis

84 A.Listeri

61 A.Coustani

58 A. Marshalli

49 A. Rufipes

23 A. Squamosus

14 A. Cinereus

7 A. Demeilloni

2 A. Maculipalpis

2 A. nili

34 Unidentifiable Ano helines

(b) Larval Searching. The field assistants on the irrigation schemes and the mobile teams carried out larval searching during part of September. Larval searching was also carried out at other times as and when necessary, results of identifications being as follows:

A. Gambiae from Dokolwako, Tshaneni, Mpaka, Nsoko, Ngomane, Nkambeni, Sivunga, Mpofu, Big Bend, Nyakatho, Nkalashane, Qandatshe.

29 A. Funestus type from Sivunga dn Nyakatho.

Other Anopheles larvae identified were:

A. Maculipalpis

A. Pretoriensis

A. de Meilloni

A. Rufipes

A. Rivolorum

A. Leesoni

A. Marshalli

A. Coustani

(c) Assessment of Behaviouristic Changes. Entomological surveys were conducted in certain areas where indigenous malaria cases occurred in order to assess possible behaviouristic changes. The following table reflects these special investigations:

Conclusions.

At Mpofu no A. gambiae were found indoors. Outside biting and resting may therefore have been taking place (6 indigenous cases).

At Tulwane no A. gambiae or A. funestus were found indoors. It was not possible to establish whether the outside resting A. funestus gr. were A. funestus type (4 Indigenous cases)

A.langa, no vectors were ever found. (5 Indigenous cases)

At Gundwini, 1 A. gambiae was found indoor 3 Indigenous cases)

At Nyakatho, A. funestus gr. was no found to be biting man (see results of Precipitin Tests: Section 8 (d). 1 A.gambiae was found in a hut in March 1966 and A.gambiae larvae only in June, 1966.

Exophagy by A. gambiae was not established but could possibly exist.

(2 Indigenous cases)

Messrs. Burroughs Wellcome and Co. Results were as follows: Precipitin tests were carried out at the Health Office, Manzini with Anti-Human Rabbit Precipitating sera obtained from

7. LEPROSY.

REPORT OF MBULUZI LEPROSY HOSPITAL

The statistical charts at the end of this Rep rt will show that the work at the Leprosy Settlement has remained at about a plateau with previous years.

The treatment has remained approximately the same with the standard usage of the drugs D.A.P.D.S. plus Blaud's Pills and yeast. Naturally there are variations to this to take care of complications when needed.

The school at the Settlement functioned during the year, with a total of eight students. It was taught by Patient Tandi Fakude.

During the year the population at the Settlement remained the same with 26 admissions and 26 discharges.

The farm has continued to render efficient and needed supplemental help with the food problem and there are well over 60 head of cattle with numerous goats and chickens, all taken care of by Settlement Personnel.

The grant from the Oxford Committee for Famine Relief has continued to be a great boon during the year and has helped considerably with the farming.

It has been a tremendous boost to the morale of the patients as well as the Staff to see the number of interested organisations and individuals who have come to the Leprosy Settlement during the year and have done so much to raise the level of morale. Regular visits by Mr. C.B. Pretious of the Red Cross, as well as members of the Rotary Anns and the Rotary Club have been of great practical benefit.

The Christmas Party, as usual, was the highlight of the year with a number of outstanding personalities attending. The guest list included Sir Francis and Lady Loyd, Her Majesty's Commissioner for Swaziland, Dr. and Mrs. Charles Runciman, Mr. A.Z. Khumalo, Member for Health, and Mr. and Mrs. Donald R. Day, Director of Education, Swaziland Government.

The clinical manifestations of the disease have been similar to that of previous years. The types of complications treated are roughly as follows:

Trophic ulcers - approximately 17 per day were treated and dressed. Lepara reactions amounted to 7 per day.

There was one death due to cancer of the bone.

There are a number of needs for equipment which can be itemised:

Four walkers - preferably of the aluminum tubular type.

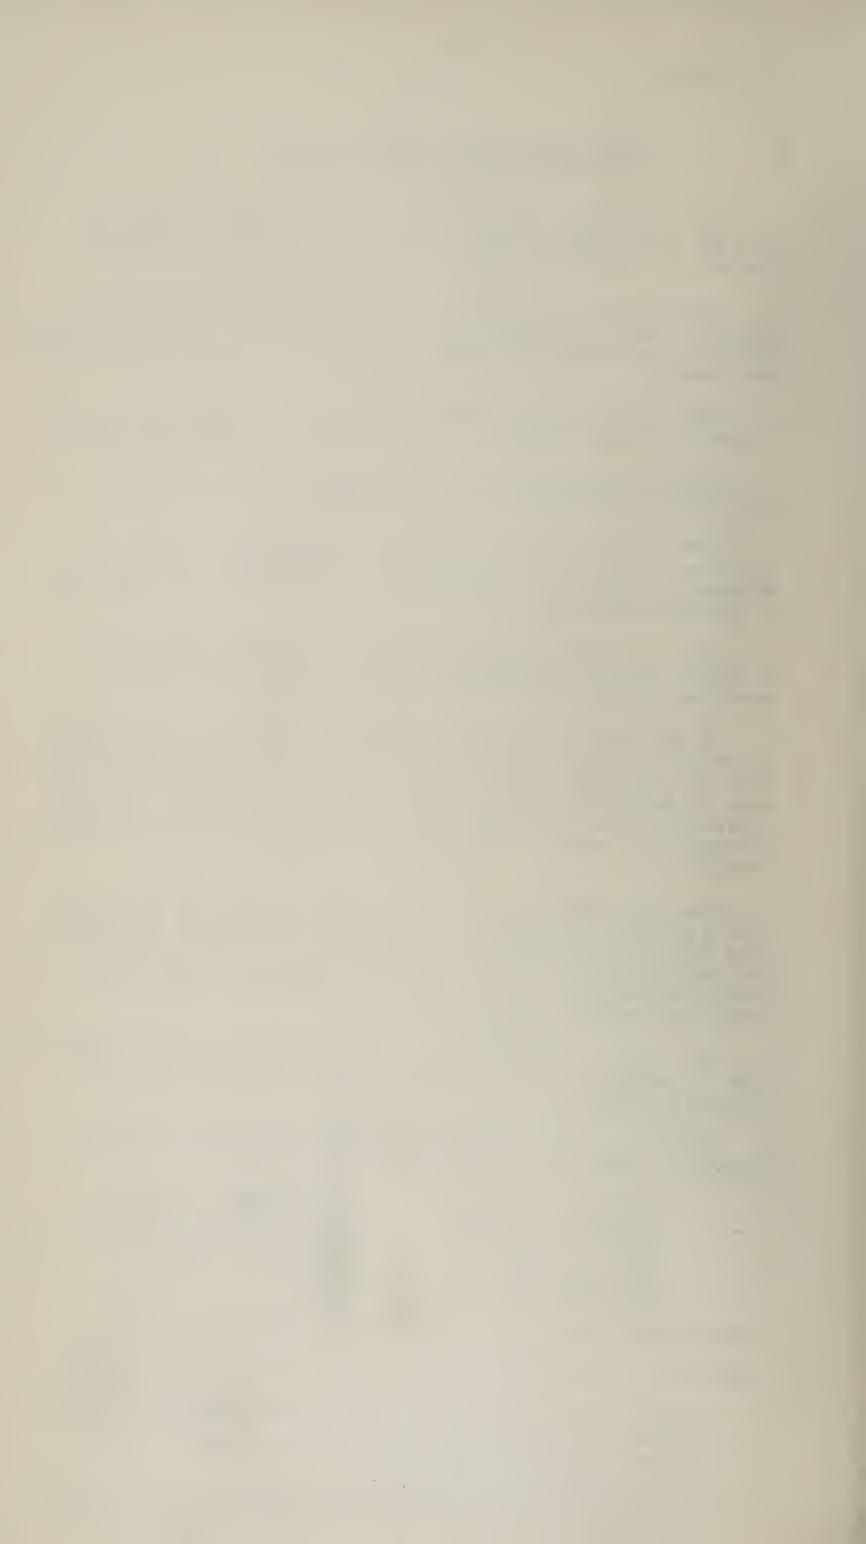

Crutches - at least six pair, and

Assortment of instruments for the dressing tray.

Dental forceps for extractions

An instrument tray for sterilising intruments

Two and 20 cc. syringes with No. 22 and No. 21 gauge needles.

There is also a need to pipe water into the ward. Screens are rather badly needed on some of the windows at the Leper Hespital, as well as in some of the Staff quarters.

Following are the statistical studies of interest:

I Additions to Leprosy Hospital Population.

	Males	Females	Total
Admissions Readmissions	7 8 15	6 5 11	13 13 26
II Losses to Population			
Deaths Desertions Discharges III Origin of Patients	1 1 17	1 - 9	2 1 26

	21.9	12.9	4.4	3.6	42.8

May I express the deep gratitude of the Staff by sincerely thanking the officers of the Medical, Agricultural, Veterinary and Public Works Department who have all had a major part in the efficient functioning of the Leprosy Settlement. In addition our sincere thanks to the Church of the Nazarene and the Raleigh Fitkin Memorial Hospital under whose care the clinical work of the Leprosy

Settlement is maintained. It is through them that the Staff of the Leprosy Settlement is supervised and also furnished.

The Mission to Lepers have furnished most needed financial aid and other types of support, without their help the Leper Settlement could not have functioned at the level at which it has.

To the numerous friends who have been so generous with their time and donations, we thank you.

Medical Superintendent, R.F.H. Hospital and its Ancillary Institutions.

8. BILHARZIA

(a) Ecological Surveys.

R.C. WEIR. MZIMNENE RIVER, MANZINI

Although this study has been concluded it was decided in view of the exceptionally heavy rainfall in January viz. 189.5 mm. to carry out a further survey to ascertain the scouring effect on the snails. The following is the result of this survey carried out on the 24th January:

- N.B. 1. Bayluscide applied by knapsack sprayer.
 - 2. Copper Sulphate applied by mixing with sand and broadcasting by hand.
 - 3. Figures in brackets indicate dead snails.
 - 4. It is not known with certainty whether the proportions of live to dead snails as indicated on 1st July, 1966 and 8th July, 1966 are correct.
 - 5. On 16th September, 1966, $\stackrel{+}{-}$ 100 yards which amounted to half the area under control, were treated with copper sulphate applied by means of a pump and the other half of the area was treated with copper sulphate and sand mixture applied by hand.

On 19th September, 1966 a survey was carried out and the results obtained were compared.

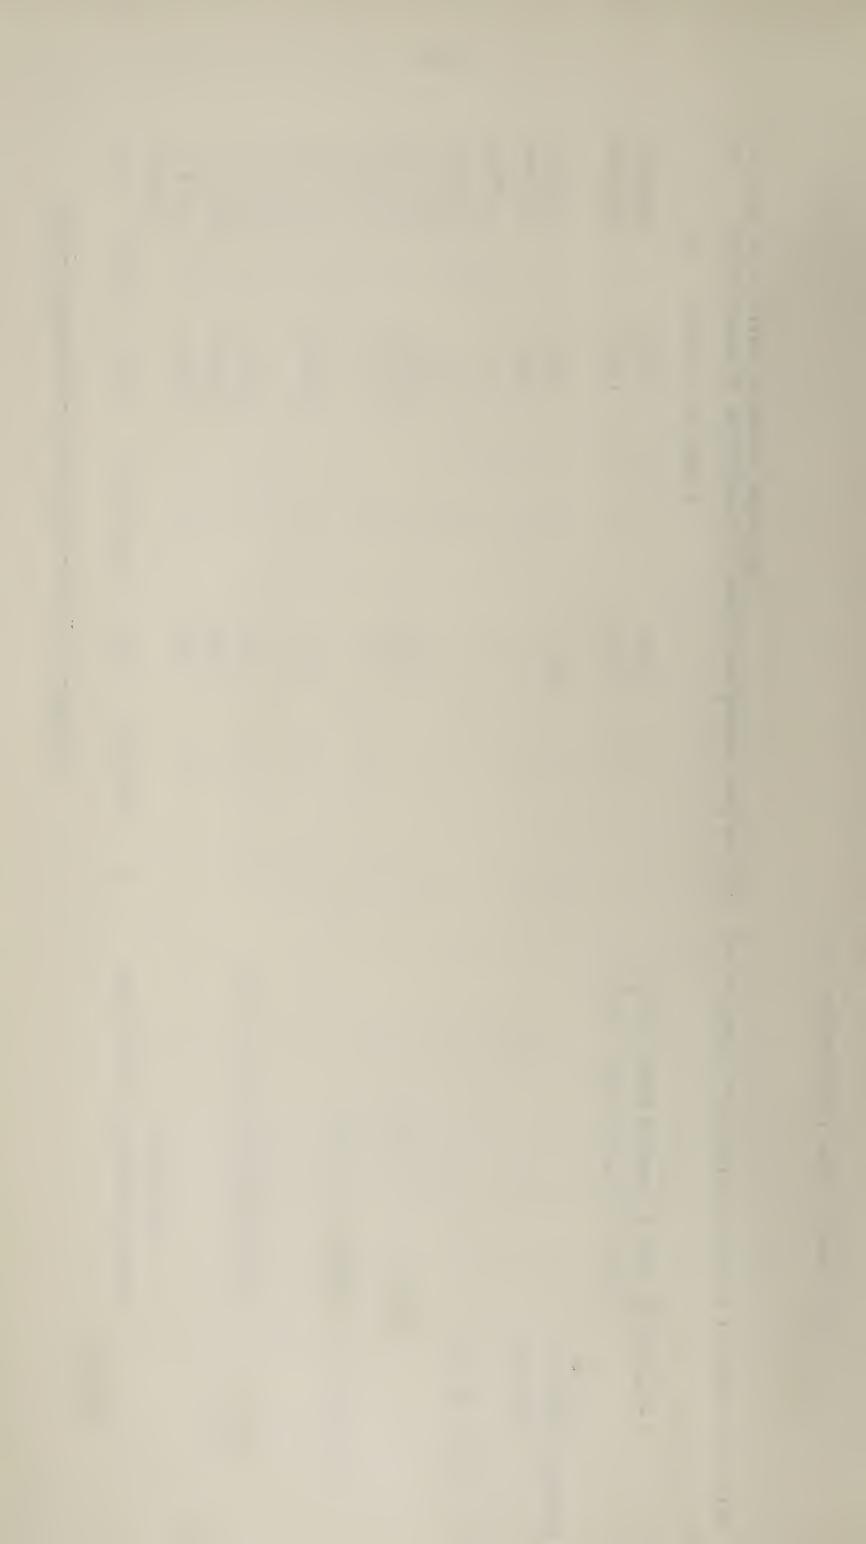

These results do not establish the superiority of the one method over the other, but iw as found that the pump method required less copper sulphate and was quicker.

(g) BILHARZIA SKIN ANTIGEN TESTS.

Skin antigen tests with W.H.O. Reference Skin Test Antigen (Melcher's sterile acid-soluble protein fraction or S. manzoni adults) were performed on 20 people from the Sidney Williams School, 19 of whom had bathed in Mzimnene River in Manzini.

Whilst 10 of these were positive, a number of urine specimen from all 20 and 2 stool examinations from each of 18 were negative.

(h) PROPAGANDA.

Talk on Bilharzia. As a result of the concern of the Head Teacher about the high incidence of schistosomiasis amongst his pupils, a talk was given on Bilharzia prevention to the pupils of Madubeni North School, Hho Hho district.

Southern Swaziland Show. A Bilharzia exhibit was arranged at the Southern Swaziland Show at Goedgegun.

Swaziland Show Manzini. A. Bilharzia wxhibit was arranged at the Swaziland Show Manzini.

Lecture on Bilharzia - Agricultural College - Luyengo. A lecture on Bilharzia and Malaria was given to domestic science demonstrators attending a training course at the Agricultural College at Luyengo.

(i) Urine and stool examinations at the Health Office, Manzini 440 urines and 19 stools were examined at the Health Office, Manzini for Bilharziasis.

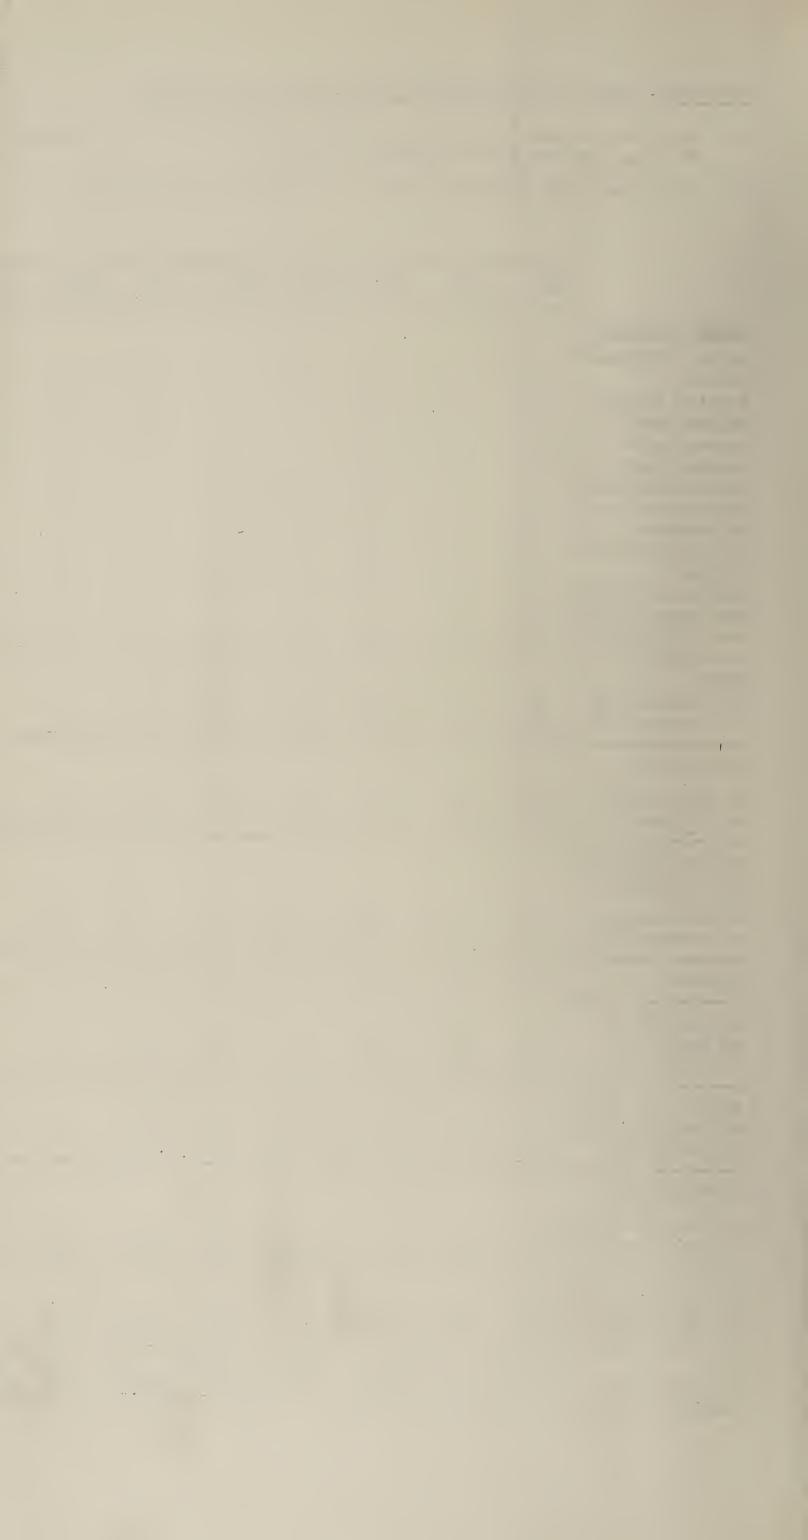

HEALTH INSPECTOR.

2. HAVELOCK MINE HOSPITAL

The number of Africans who were not mine employees or their dependants who were treated at the Havelock Mine Hospital during 1966 was as follows:

Number of Admissions	262
Number of Outpatients New	Cases 896
Rea	ttendances 1436
In-patient days	1607
Daily number of In-patient	s 45

3. MEDICO-LEGAL POSTMORTEM EXAMINATIONS

The number of medico-legal post-mortem examinations carried out at Government and subsidised Mission Hospitals from 1964 to 1966 were as follows:

	1964	1965	1966
Mbabane Hospital	46	51	33
Raleigh Fitkin Memorial Hosp.	106	94	8787
Piggs Peak Hospital	26	31	60
Good Shepherd Hospital	24	35	56
Hlatikulu Hospital	45	50	91

Medico-legal requests from the Police for the examination of Assault and Rape cases totalled 215 at Mbabane Hospital. Figures from other centres are not available at present. 21 examinations were done at Mbabane Hospital in cases of alleged driving under the influence of liquor or drugs.

,

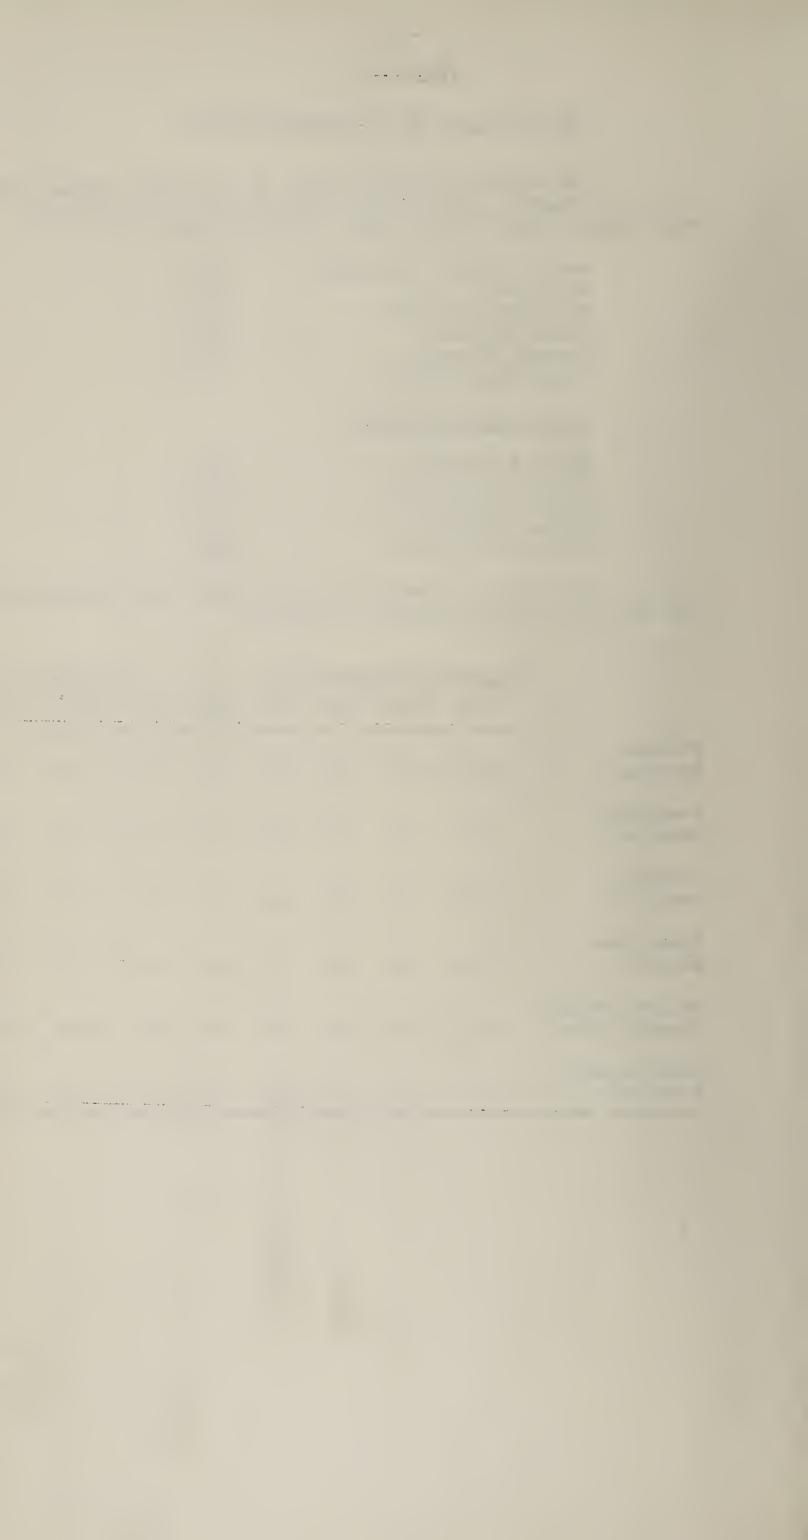

MATERNITY AND CHILD WELFARE SERVICES

Ante-Natal Clinics, outside of hospitals, produce the following figures, which are not complete, as not all clinics were notified early in the year to keep records:

Mobile Clinic - Hlatikulu	2028
Mankaiana	735
Hlatikulu District	5630
Stegi District	699
Manzini District	2069
Piggs Peak District	47
Child Welfare Clinics:	
Mbabane District	272
Mankaiana District	12352
Piggs Peak District	52
Manzini District	2940
Hlatikulu District	16905

The number of ante-natal examinations and confinements for the past 4 years has been as follows:

	Antenat	al Exa	minati	onsa		Co	nfinem	ents:
	1963	1964	1965	1966	1 963	1964	1965	1966
Mbabane Hospital:	2189	2132	3302	3644	691	756	842	1047
Hlatikulu Hospital:	844	843	941	1274	339	355	405	539
Mankaiana Hospital:	185	331	2 54	304	135	103	142	147
Piggs Peak Hospital:	1165	779	924	650	280	231	250	286
Raliegh Fitkin Memorial Hosp:	3720	2083	3264	3181	919	1074	1202	1139
Good Shepherd Hospital:	1251	953	1330	1428	155	226	224	130

CHAPTER V

LABORATORY SERVICES:

The work in the Mbabane Laboratory has shown a 50% increase during the year, but histological examinations and other special investigations are carried out by the South African Institute for Medical Research in Johannesburg.

Small laboratories are situated in the following hospitals - Mbabane, Hlatikulu, and Raleigh Fitkin Memorial, and Good Shepherd are equipped for carrying out simple routine tests.

The W.H.O. TB. Project Laboratory in Manzini now undertakes all examinations for tuberculosis both for hospitals and private practitioners. The Laboratory at the Health Office in Manzini undertakes all examinations for malaria and bilharzia; the results of these examinations are reported under the sections dealing with Malaria and Bilharzia and are not included in the figures which follow:

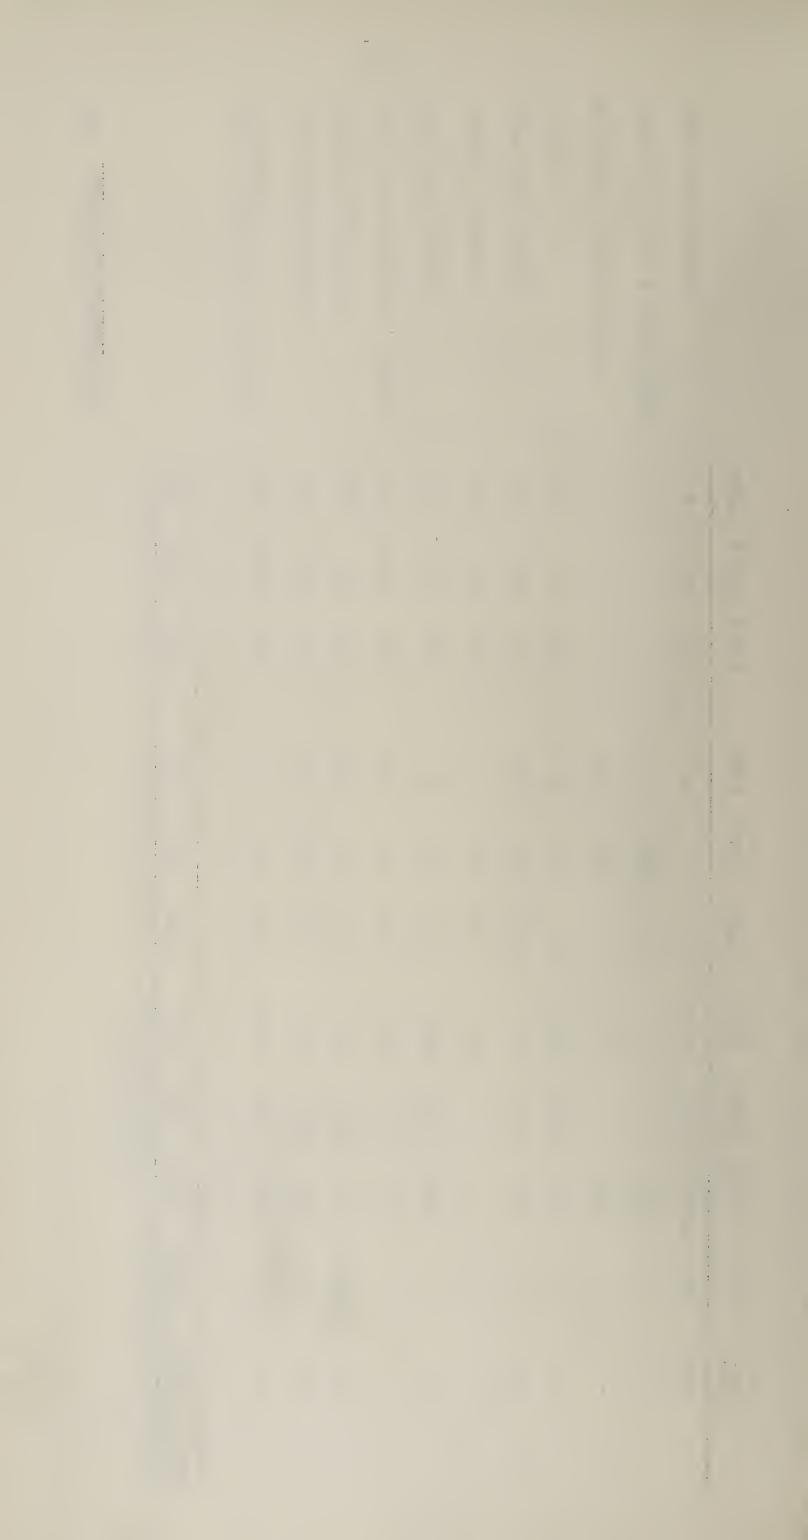

a) PATHOLOGY LABORATORY MBABANE
